

Ratio Tables That Tell a Story

Grade 6 • Mathematics
NC.6.RP.3

Use unit rates and equivalent ratios.

What will a strong explanation show?

1. A model or equation that fits the quantities.
2. Accurate calculation with appropriate units.
3. A check that makes the answer reasonable.

Watch the reasoning

The science club uses 15 labels for 3 equal kits. At the same rate, how many labels are needed for 11 kits? Make a ratio table including one kit.

Unit rate: $15 \div 3 = 5$ labels/kit. Table pairs: (1,5), (3,15), (11,55).

Build a second model together

The design team uses 4 labels for 2 equal kits. At the same rate, how many labels are needed for 12 kits? Make a ratio table including one kit.

Discuss: What should the first step find?

Your turn • 1

The reading group uses 16 labels for 8 equal kits. At the same rate, how many labels are needed for 10 kits? Make a ratio table including one kit.

Represent → solve → explain → check

Your turn • 2

The music club uses 35 labels for 7 equal kits. At the same rate, how many labels are needed for 11 kits? Make a ratio table including one kit.

Represent → solve → explain → check

Your turn • 3

The science club uses 20 labels for 5 equal kits. At the same rate, how many labels are needed for 11 kits? Make a ratio table including one kit.

Represent → solve → explain → check

Your turn • 4

The music club uses 63 labels for 9 equal kits. At the same rate, how many labels are needed for 9 kits? Make a ratio table including one kit.

Represent → solve → explain → check

Exit question • Explain independently

The design team uses 48 labels for 8 equal kits. At the same rate, how many labels are needed for 9 kits? Make a ratio table including one kit.

Include a check. What would you teach someone else?

Teacher review and next steps

1. 20 labels

2. 55 labels

3. 44 labels

4. 63 labels

Exit: 54 labels

Use the worked PDF key and slide notes to discuss methods. Revisit the earliest unclear step before adding more practice.
