

Asking for Help with Confidence Toolkit

Pre-K-Grade 12 • Educator and family planning

Make help-seeking specific and accessible

An original professional toolkit with a five-step routine, rehearsal activities, printable displays, a room-layout planning diagram, observation tools, family pages, and a new-teacher run sheet.

PRINT • TEACH • REVISIT

Choose the version your learners need

Objective

Make help-seeking specific and accessible. This is an adult planning resource; it is not a state-aligned academic worksheet, an individualized intervention, or a crisis plan.

Pre-K and Kindergarten

Use one spoken step, a real object or adult demonstration, and a brief supported rehearsal. An adult records observations; children do not need to read the planning forms.

Grades 1-2

Teach two steps at a time. Pair the printed cue with an example and let learners show or tell what comes next.

Grades 3-5

Let students explain the sequence, practice roles, and offer one suggestion. Use a short written or drawn reflection.

Grades 6-8

Offer private feedback and meaningful choices. Ask learners to identify barriers in the routine and help revise one step.

Grades 9-12

Connect the routine to increasing independence, collaborative projects, and self-advocacy. Invite students to assess whether the system is useful and respectful.

Teach the routine explicitly

Situation to plan for: A student waits silently for much of independent work after getting stuck on the first item.

1. Teach an accessible help signal

Describe what students should see or hear. Start with the actual situation: A student waits silently for much of independent work after getting stuck on the first item.

2. Name the exact point of confusion

Model the action instead of only naming it. Keep the cue short: "Name the exact point of confusion."

3. Try one available support

Invite a supported rehearsal. Offer a spoken, drawn, or demonstrated response so participation is not limited to writing.

4. Ask a person with a specific question

Watch one learner or pair try the sequence. If the step is unclear, revise the cue or the environment before repeating it.

5. Return to one manageable step

Ask what helped. Notice a concrete action, then decide whether to keep or adjust the routine.

Language that teaches the next action

A usable adult script

Show me the last step that made sense. We can choose a model, a prompt, or a short explanation together.

A response to avoid

Requiring a student to try three strategies before any help, even when access or comprehension is already a barrier.

Rehearse with a colleague

Read the situation. Person A uses the script; Person B responds as a learner who needs the first step clarified. Switch roles. Identify the exact words that made the action more understandable.

Your adapted script, using language natural to your classroom:

Three decision cases

1. The first cue does not work

A student waits silently for much of independent work after getting stuck on the first item. The adult repeats the same words louder. What information should the adult check, and what could change?

2. The routine works for some learners

Most students use the routine, but one learner needs a different response method. How can the goal stay consistent while access changes?

3. Students propose an improvement

A learner says one part of the routine is confusing and suggests a simpler cue. How should the adult respond?

Decision-case response guide

1. The first cue does not work

Check whether the learner can access the cue, understands the first action, and has the needed materials. Model “Teach an accessible help signal” and invite a supported rehearsal. Increasing volume alone does not clarify the step.

2. The routine works for some learners

Keep the goal “make help-seeking specific and accessible.” Offer demonstration, oral response, reduced copying, or another documented support. Compare the actual learning or participation evidence, not whether every learner used an identical method.

3. Students propose an improvement

Ask the learner to demonstrate the confusing point. Try a small change to “Try one available support,” explain any non-negotiable school requirements, and review whether the revised cue helps participation.

Other responses can be appropriate when they preserve dignity, teach a specific action, follow school procedures and individual plans, and include a way to review the result.

Asking for Help with Confidence

- 01** Teach an accessible help signal
- 02** Name the exact point of confusion
- 03** Try one available support
- 04** Ask a person with a specific question
- 05** Return to one manageable step

Pause. Find your next step.

NOTICE

What is happening? What do I need to understand?

CHOOSE

Teach an accessible help signal.

TRY

Try one available support.

CHECK

Return to one manageable step.

A room layout you can adapt

Conceptual layout, not a measured floor plan. Preserve required exits, accessible routes, sight lines, and school rules. The display supports a routine; it does not replace teaching it.

Display focus: Teach an accessible help signal

Use a routine cue where the action begins. Locate materials so learners can find them. Provide a seated or alternative response route without isolating the learner.

Make the display earn its space

Before posting

Print the routine display and the desk cue. Read both from the distance at which students will use them. Enlarge if needed; pair text with real demonstrations for nonreaders.

Introduce it

Point to the exact step during rehearsal. Ask learners where the cue would be most useful. A poster becomes instructional when students know how to use it.

Keep it usable

Reduce competing visual clutter near the cue. Keep copies reachable and avoid placing private observation records or student comparisons on display.

Review after a week

Ask learners to locate the cue and explain its next action. If they cannot use it, revise placement, wording, or instruction instead of adding more posters.

Visual rights

The typographic posters and functional layout diagram are original Saint Pierre Learning Resources designs. The unchanged KSP logo is the store's supplied brand asset. No stock photography or third-party illustration is included.

Try the routine in a real activity

Activity 1 • Rehearse and revise (15-20 minutes)

Pairs compare vague help requests with specific ones. They rewrite “I do not get it” as a question about a word, direction, or operation.

Prepare blank paper and the printed cue. Model one turn, let partners rehearse, then ask each pair to name one useful step and one improvement. Collect a drawn, oral, or written response.

Activity 2 • Teach a new classmate (15 minutes)

Partners make a short guide for a fictional learner joining the class. Include the purpose “make help-seeking specific and accessible,” the first action, where help is available, and one example of success. Swap guides and test whether the next step is clear.

Success criteria: the guide names an observable action, is understandable to the intended learner, offers a help route, and avoids public judgment of classmates.

My routine rehearsal

The routine helps us...

The first action I can show is...

A cue or material that would help me is...

If I am unsure, I can...

One change I would suggest is...

Review what happened

What action did you observe? Write or draw a concrete example.

Which part was clear, and what evidence supports that view?

What barrier appeared? Consider directions, materials, time, space, or response method.

What one change will you try next, and how will you know whether it helped?

A supportive response plan

Describe, then inquire

A student waits silently for much of independent work after getting stuck on the first item. Describe only what you observed. Ask a neutral question about the difficult step before deciding why it happened.

Teach the alternative

Show me the last step that made sense. We can choose a model, a prompt, or a short explanation together. Demonstrate the action and provide an opportunity to rehearse with support.

Adjust access

Check the learner's existing plan, task demands, language access, and environment. Choose a support with the learner and relevant staff rather than inventing a diagnosis.

Notice progress

Record a concrete example of participation, such as beginning a step, requesting clarification, or using the cue. Avoid public ranking charts.

Review and refer appropriately

Use the observation form to decide whether the classroom routine needs adjustment. Persistent or safety-related concerns belong with the school's designated support team and procedures.

Private observation record

Date / setting / task (avoid unnecessary personal details):

What happened immediately before the observed action?

What did the learner actually say or do?

What cue, model, or access support was offered?

What happened next?

One next instructional adjustment and review date:

Practice neutral observation

Prompt: Replace “The student did not care” with an observation based on the scenario.

Possible response: A student waits silently for much of independent work after getting stuck on the first item. This names visible actions and the setting without claiming to know the learner’s motives.

Prompt: What additional information would be useful?

Ask whether the learner understood the first step, could access the materials or response method, and had the needed support. Note what changes after one specific adjustment.

Prompt: What would count as improvement?

A reasonable example is a learner using one step of the routine with a support that works for them, then rejoining the task. Define the observation before collecting it; do not assume fewer visible movements or faster completion alone means better learning.

A home connection that stays manageable

Shared purpose

Make help-seeking specific and accessible. The family page supports a short conversation and one manageable routine; families do not need to reproduce the whole classroom system.

Try this

Use “Show me where you got stuck” during homework or a household task. Praise the specific request, not speed.

Conversation opener

“What part feels clear? What part is difficult? Would it help to show me, draw it, or try the first step together?”

Keep school and home connected

Share a neutral observation and ask which support is already agreed at school. Use the child’s perspective and avoid comparing siblings or classmates.

If it is not helping

Stop and simplify the routine. Ask the teacher or relevant support professional to help review persistent barriers. This general guide does not replace an individual education, health, or support plan.

One small step at home

Use “Show me where you got stuck” during homework or a household task. Praise the specific request, not speed.

The one step we chose:

What the child said, showed, or asked:

What helped, and what we will adjust:

A five-day family check-in

Use a brief note or drawing. This is not a reward chart or a diagnostic measure. Skip a day if the routine is not relevant.

Day 1 • What we tried / what helped / next adjustment

Day 2 • What we tried / what helped / next adjustment

Day 3 • What we tried / what helped / next adjustment

Day 4 • What we tried / what helped / next adjustment

Day 5 • What we tried / what helped / next adjustment

A new teacher's first-week run sheet

Before Day 1

Learn the school's procedures and where individual supports are documented. Choose one routine, not a complete classroom overhaul.

Day 1: explain and model

Use the goal "make help-seeking specific and accessible." Demonstrate "Teach an accessible help signal" and allow a supported rehearsal.

Day 2: observe

Use the private record for one short period. Look for barriers in the task and environment as well as the learner's response.

Day 3: ask and adjust

Invite feedback about "Try one available support." Change one cue or material, then explain why.

Day 4: connect with home

Use the family page only when relevant. Explain the shared purpose and ask for perspective rather than assigning families a new enforcement role.

Day 5: review

Compare concrete observations. Keep the parts that help, revise a confusing step, and ask a mentor for support when needed.

Check your plan before using it

1. Name one observable action the routine teaches.

2. Write the first cue in language your learners can use.

3. Describe an access option that keeps the goal intact.

4. Identify one response to avoid and explain why.

5. Choose one observation and a date to review the routine.

Exit-ticket response guide

1. Teach an accessible help signal. Other concrete actions from the routine are acceptable.
2. Show me the last step that made sense. We can choose a model, a prompt, or a short explanation together.
3. Examples include oral response, demonstration, a visible step cue, reduced copying, or a support in the learner's existing plan. Explain how it still serves the goal.
4. Requiring a student to try three strategies before any help, even when access or comprehension is already a barrier.
5. Choose a specific action in a defined setting, such as use of the first cue during the opening task. Name a realistic review date and the adjustment the observation will inform.

Use this as a planning check. A response is useful when it is specific, respectful, feasible, and connected to evidence. There is no certified score or universal compliance claim.

Access and responsible use

AIG: Invite learners to evaluate and redesign a routine, compare alternatives, or lead a consent-based demonstration. Do not make advanced learners permanent peer supervisors.

504: Follow the individual plan for pacing, breaks, environment, and response methods. A posted routine does not replace documented accommodations.

EC: Use the IEP and relevant team guidance. Model one step, provide supported practice, and adapt communication and response options.

ESL: Use plain language, demonstrations, home-language discussion, and short sentence frames. Families may respond in their preferred language.

Preparation and printing: Print selected US Letter pages at actual size; enlarge display pages if useful. Forms are printable, not digitally fillable. Keep completed observation and family records private.
